Seagrass Restoration Trade-offs

Seminar activity · University · Reflect stage · 45 minutes
Shared by Dr. A. Rahman, Example University · Built on OceanX Seagrass Stories

What this is

A structured seminar debate I ran after the Seagrass Stories game. Learners take stakeholder roles and argue which restoration choice their community should fund, then map the consequences using the Map the chain causal chain (Choice or Action, Consequence, Habitat Response, Change Over Time).

Learning goals

- Explain how one restoration choice leads to consequences for the habitat over time.
- Weigh trade-offs between different groups who depend on the coast.
- Use evidence from the session videos and game, not opinion alone.

Session plan

Time	Step	What learners do
0 to 5 min	Set up	Recap the game. Assign roles (see below). One role card per group.
5 to 15 min	Prepare	Each group picks one restoration choice and builds a 4 step causal chain on Post-its.
15 to 30 min	Debate	Groups present for 2 minutes each. Others may ask one challenge question.
30 to 40 min	Re-map	Groups add one unintended consequence raised in the debate to their chain.
40 to 45 min	Exit ticket	Each learner answers the exit ticket individually.

Stakeholder roles

- **Local fishing community**: cares about fish stocks and access to the shore.
- **Coastal developer**: wants to build, open to offsetting impact.
- **Restoration scientist**: cares about which sites can actually recover.
- **Government agency**: limited budget, must justify the spend.
- **Youth climate group**: focused on long-term change and carbon.

Debate prompts

- Who benefits first from this choice, and who waits longest?
- What would have to be true at the site for restoration to work?
- What is one consequence your chain did not show at first?

Exit ticket

In two sentences: which choice would you fund, and what is the biggest risk in your causal chain?

Notes from running it

- Learners argued from evidence more when the scientist role could challenge claims.

- Keep presentations to 2 minutes or the re-map step gets cut.
- Works with 15 to 30 learners in groups of 3.
